

FOR DEV:

- Conceptual Framework
 1. Ano po yung mga ginamit na software or software requirements?
- Non-functional Requirements (Portability)
 1. Saan po portable/compatible na operating system ang mobile front-end ng system/app? Yung web-based naman po, saang search engine naman po siya masesearch? Like Google chrome, edge, or the likes po.
- Technical Feasibility
 1. Saan po nadevelop yung system or ano pong ginamit na platform or IDE? pati po yung database na ginamit.
- Compatibility Checking
 1. device platform
 2. software versions
 3. cpu/storage

Ano po yung certain units na compatible sa mga sumusunod
- Tracking
 1. Google Maps API po ba yung ginamit sa system for tracking?
- Economic Feasibility
 1. Baka po may masama po kayo sa expenses na nagastos.
- Cybersecurity part

Authentication & Authorization

- How are user passwords stored? (e.g., hashed using bcrypt or Argon2)
- Does the system implement Role-Based Access Control (RBAC)?
- How are user passwords stored? (e.g., hashed using bcrypt or Argon2)
- Does the system implement Role-Based Access Control (RBAC)?
- Can users only access features based on their assigned role (Admin, Dispatcher, Responder, Reporter)?
- Is there a session timeout for inactive users?

Database Security

- How do we prevent SQL Injection attacks?
- Are prepared statements or parameterized queries used?
- Is database access limited only to authorized users or services?
- Are regular database backups implemented?

Incident Reporting Security

- How do we prevent fake or spam incident reports?
- Is there a verification process before dispatching responders?
- Are all incident reports logged for auditing?

Availability & Disaster Recovery

- What happens if the server goes down?
- Is there a backup and recovery plan?
- How often are backups performed?

General Security Practices

- How are software updates managed?
- Are security patches applied regularly?
- Has the system been tested for vulnerabilities?
- What cybersecurity standards or best practices are followed?
